## 1 Introduction

In this lab, you will be extracting information from web pages and learning how to plot some of it.

## 2 HTML

As you may be familiar, HTML is the main formatting language of the Internet.

## 3 BeautifulSoup

What do?

How do?

We gave it to you.

Example

## 4 Matplotlib

Matplotlib is a neat library for plotting in Python. It works similarly to MATLAB plotting so that people with experience in that can easily switch over; however, we will give you our own introduction to it.

Let's plot the following  $x$  and  $y$  coordinates:

<b>x</b>	0	2	4	6	8	10	12	14	16	18
<b>y</b>	0	4	8	12	16	20	24	28	32	36

**Table 1:** Values for Figure 1

```

1 import matplotlib.pyplot as plt
2
3 x = range(0, 20, 2)
4 y = range(0, 40, 4)
5 plt.plot(x, y, '.')
6 plt.xlabel('X values')
7 plt.ylabel('Y values')
8 plt.title('Random plot of X vs Y')
9 plt.show()

```

**Listing 1:** Code to produce Figure 1 with values from Table 1

**Figure 1:** Graph produced by Listing 1

The `plt.plot()` function takes as arguments a sequence for  $x$ , a sequence for  $y$ , and optionally a formatting specifier. The important ones are “-” for a solid line and “.” for point markers. You

can add more options, such as colors or labels. You can find more docs on these specifiers on the Matplotlib website:

[http://matplotlib.org/api/pyplot\\_api.html#matplotlib.pyplot.plot](http://matplotlib.org/api/pyplot_api.html#matplotlib.pyplot.plot)

You have to call `plt.show()` for the graph to actually show. There are ways to print the graphs to image files, but we are not covering those for now. You can look them up in the documentation if you want.

Bar plots work in a similar way. The `plt.bar()` takes a sequence of numbers to label the left side of the bars with and a sequence of heights of the bars.

```
1 import matplotlib.pyplot as plt
2
3 x = range(1, 11, 2)
4 y = range(1, 21, 4)
5 plt.bar(x, y)
6 plt.show()
```

**Listing 2:** Code to produce Figure 2

**Figure 2:** Graph produced by Listing 2

These are the two main functions you will need for plotting in this lab. If you want to customize more, please see the matplotlib pylab documentation at

[http://matplotlib.org/api/pyplot\\_summary.html](http://matplotlib.org/api/pyplot_summary.html)

## 5 Wikipedia

That one thing that russell found (about the philosophy link)

## 6 Exercises

### Boilerplate

Remember that this lab *must* use the boilerplate syntax introduced in Lab 5.

`file.py`

## 7 Submitting

Files to submit:

- file.py (Section 6)

You may submit your code as either a tarball (instructions below) or as a .zip file. Either one should contain all files used in the exercises for this lab. The submitted file should be named either `cse107_firstname_lastname_lab11.zip` or `cse107_firstname_lastname_lab11.tar.gz` depending on which method you used.

For Windows, use a tool you like to create a .zip file. The TCC computers should have 7z installed. For Linux, look at lab 1 for instructions on how to create a tarball or use the “Archive Manager” graphical tool.

**Upload your tarball or .zip file to Canvas.**
