

# Lab 11: Web Scraping

CSE/IT 107

NMT Computer Science

---

“The limits of my language mean the limits of my world.”

— Ludwig Wittgenstein

“Any sufficiently advanced technology is indistinguishable from magic.”

— Arthur Clarke

“Imagination is more important than knowledge.”

— Albert Einstein

---

## 1 Introduction

In this lab, you will be extracting information from web pages and learning how to plot some of it.

## 2 HTML

As you may be familiar, HTML is the main formatting language of the Internet. HTML stands for HyperText Markup Language. As a language, it defines where content appears on a website, and how it looks. For an example, open up Google Chrome and navigate to <http://www.nmt.edu>. Right click on the webpage, and select “View Source”. What follows is the source code for [nmt.edu](http://www.nmt.edu)!

HTML is actually fairly easy to read. All content exists between various kinds of “tags”. Each tag has a special kind of meaning. Here is a simple example:

```
1 <html>
2   <body>
3     <p> This is a paragraph in the body of the page </p>
4     <p> This text is <b> BOLD </b></p>
5   </body>
6 </html>
```

To learn about all the various tags, see W3Schools.

### **3 BeautifulSoup**

BeautifulSoup is a python library used to read HTML files in a nice and easy way.

## 4 Matplotlib

Matplotlib is a neat library for plotting in Python. It works similarly to MATLAB plotting so that people with experience in that can easily switch over; however, we will give you our own introduction to it.

Let's plot the following  $x$  and  $y$  coordinates:

$x$	0	2	4	6	8	10	12	14	16	18
$y$	0	4	8	12	16	20	24	28	32	36

**Table 1:** Values for Figure 1

```

1 import matplotlib.pyplot as plt
2
3 x = range(0, 20, 2)
4 y = range(0, 40, 4)
5 plt.plot(x, y, '.')
6 plt.xlabel('X values')
7 plt.ylabel('Y values')
8 plt.title('Random plot of X vs Y')
9 plt.show()

```

**Listing 1:** Code to produce Figure 1 with values from Table 1

**Figure 1:** Graph produced by Listing 1

The `plt.plot()` function takes as arguments a sequence for  $x$ , a sequence for  $y$ , and optionally a formatting specifier. The important ones are “-” for a solid line and “.” for point markers. You

can add more options, such as colors or labels. You can find more docs on these specifiers on the Matplotlib website:

[http://matplotlib.org/api/pyplot\\_api.html#matplotlib.pyplot.plot](http://matplotlib.org/api/pyplot_api.html#matplotlib.pyplot.plot)

You have to call `plt.show()` for the graph to actually show. There are ways to print the graphs to image files, but we are not covering those for now. You can look them up in the documentation if you want.

Bar plots work in a similar way. The `plt.bar()` takes a sequence of numbers to label the left side of the bars with and a sequence of heights of the bars.

```
1 import matplotlib.pyplot as plt
2
3 x = range(1, 11, 2)
4 y = range(1, 21, 4)
5 plt.bar(x, y)
6 plt.show()
```

**Listing 2:** Code to produce Figure 2

**Figure 2:** Graph produced by Listing 2

These are the two main functions you will need for plotting in this lab. If you want to customize more, please see the matplotlib pylab documentation at

[http://matplotlib.org/api/pyplot\\_summary.html](http://matplotlib.org/api/pyplot_summary.html)

## 5 Wikipedia

In case you feel like wasting time, did you know that wikipedia has some odd properties about the philosophy page? You should read more at:

[http://en.wikipedia.org/wiki/Wikipedia:Getting\\_to\\_Philosophy](http://en.wikipedia.org/wiki/Wikipedia:Getting_to_Philosophy).

## 6 Exercises

### Boilerplate

Remember that this lab *must* use the boilerplate syntax introduced in Lab 5.

**simple\_plot.py** Using Matplotlib, make a simple plot of the function  $y = x^2$ , to make sure that you are able to use matplotlib.

**beautiful\_title.py** Like the last exercise, just to make sure the libraries are working properly, use `get_page_source` and BeautifulSoup to get the title of a user-entered wikipedia page.

**wiki\_stats.py** This comprises the majority of the project. Your task takes advantage of the “philosophy property” of most Wikipedia pages. The user will provide a list of Wikipedia article names. Your program will take this list, and return a list of the “first-link-distance” to Philosophy. If the given article does not converge to Philosophy, display the string “inft”. If the given article does not exist, display the string “N/A”.

For example, see this made up input (the numbers here are just made up, don’t worry)...

```
1 Article List: NASA, Space, Grapefruit, BadArticle
2 Philosophy Distance: [3, 6, inft, N/A]
```

So this means 3 clicks from “NASA”, you can find philosophy, but “Grapefruit” never reaches philosophy. “Bad Article” is not found.

## 7 Submitting

Files to submit:

- file.py (Section 6)

You may submit your code as either a tarball (instructions below) or as a .zip file. Either one should contain all files used in the exercises for this lab. The submitted file should be named either `cse107_firstname_lastname_lab11.zip` or `cse107_firstname_lastname_lab11.tar.gz` depending on which method you used.

For Windows, use a tool you like to create a .zip file. The TCC computers should have 7z installed. For Linux, look at lab 1 for instructions on how to create a tarball or use the “Archive Manager” graphical tool.

**Upload your tarball or .zip file to Canvas.**
